

ARCHITECTURE: SERVER ARCHITECTURE

We have significant experience implementing the following for our clients:

- Maximized server roles to provide the best server farm architecture to meet customer needs.
- Used server roles skillfully to build high availability systems.
- Architected on the server side for reliable disaster recovery.
- Used database server role definition combined with business analysis to deliver secure systems.
- Architected multiple web role servers to scale out the number of users.
- Used sound load balancing of environment connections to allow a larger number of users to access the content.
- Provided expertise in hardware and software-based load balancing using Windows Network Load Balancing (NLB).
- Provided extensible service application frameworks including third-party applications with their own service applications.
- Customized selective service application resource usage management based on your business needs.
- Applied five-tier server topology architecture principles with SharePoint 2016 for customer benefits.
- Maximized farm scalability, predictable capacity planning and other advantages provided by SharePoint 2016.
